

JPEG with Hidden Height

If I didn't explain something well this was the original article

<https://cyberhacktics.com/hiding-information-by-changing-an-images-height/>

1) First select your image and go into your photo editor of choice.

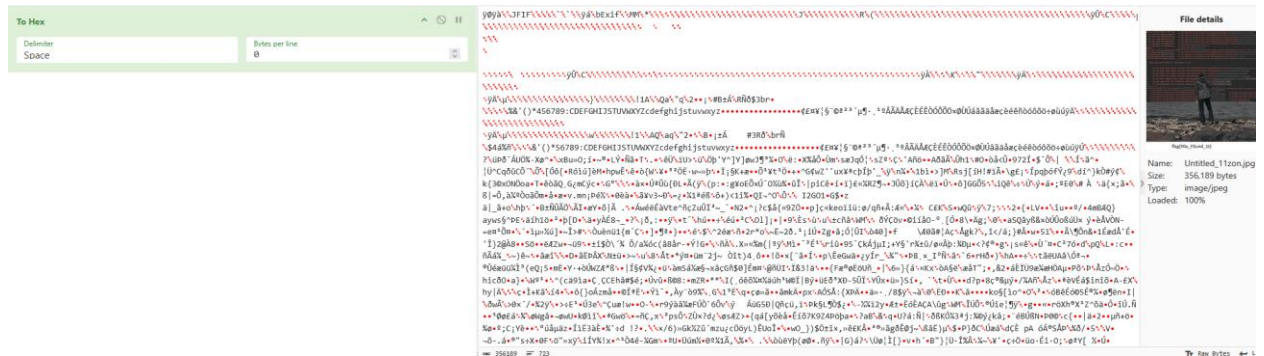

2) Now extend the image down and put a flag or smth. The secret info basically

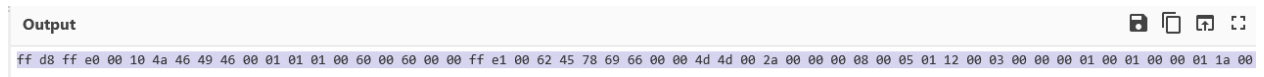

flag{YOU_F0und_it}

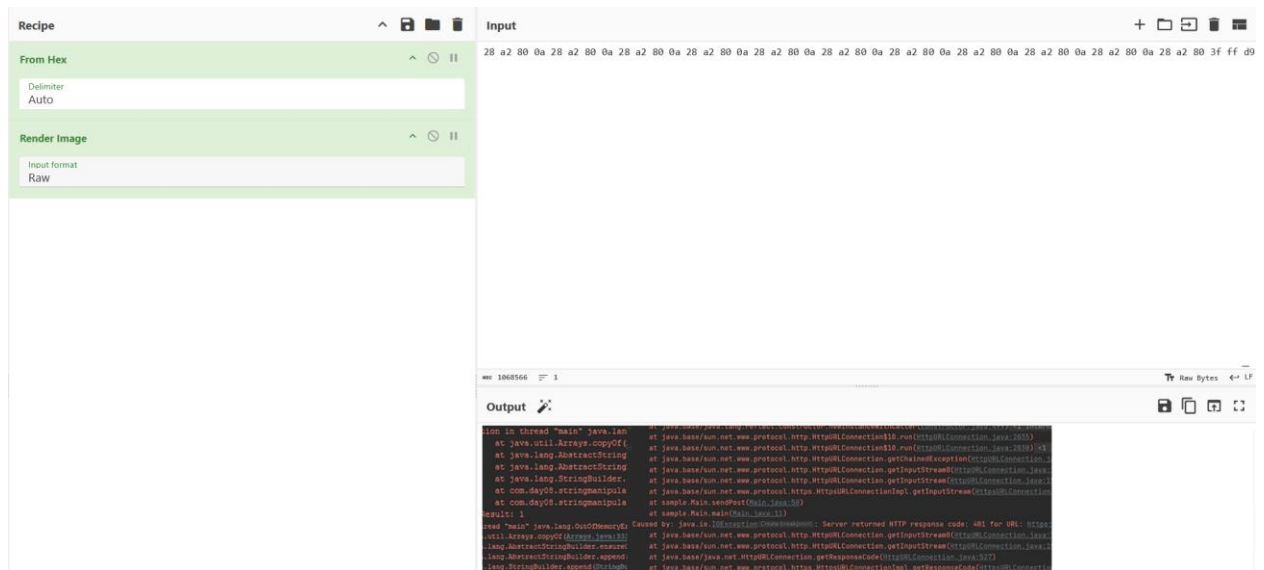

- 3) Time for CyberChef  Open Cyberchef and choose the “To Hex” and in the input put your image with the secret info

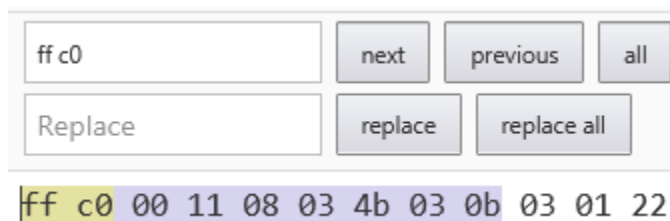

- 4) Now copy the entire output
This long ass thing

- 5) Now reset your cyberchef and for the options put “From Hex” and “Render Image”

- 6) Now CTRL F and look for “ff c0”

- 7) Now you’re only going to care about the last 4 Hex values in blue. That would be your

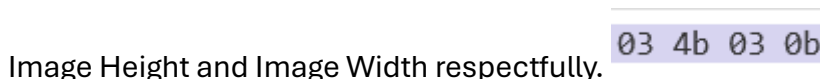

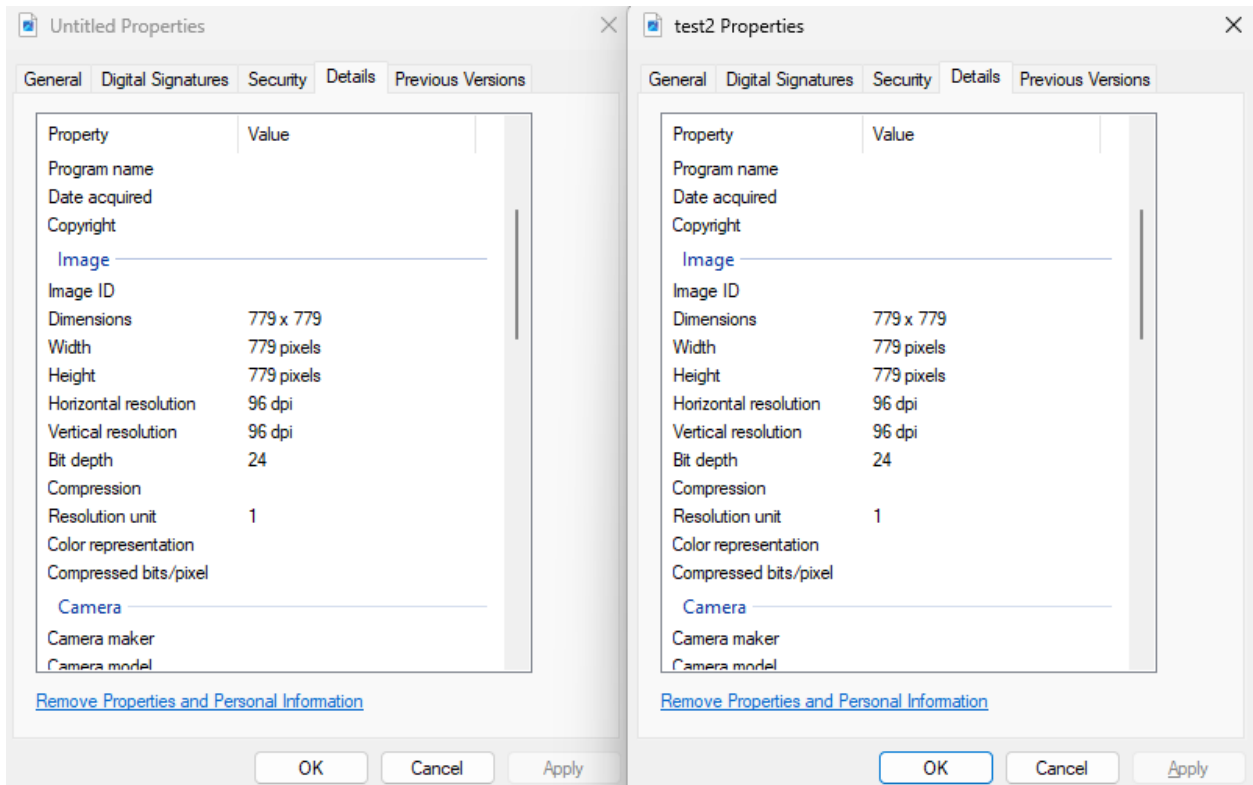

Image Height and Image Width respectively.

- 8) Now you're going to shrink your image to cover up whatever secret you hid. Im not going to tell you how to shrink it. You guys are smart enough to figure it out cause I don't know how to read Hex like that u feel me. You could always go back to the original image without the secret you had used and basically pull it up in cyber chef and look at its values if you want to make it exactly the same.

- 9) Now your text should be hidden. And if you look at the img height/width it is exactly the same as the original image you had used.

- 10) The only way I know how to solve this is to basically throw the image with the secret in it into cyberchef -> get the hex of the img -> do from hex and render image -> and then go to where we changed the height or width and increase them to show the hidden message.
- 11) Also interesting detail that I found while messing around. If you mess around with the hex value for the width you can totally offset the image and distort
