

Github pfp steganography

1st) The first thing you'll need is a profile picture. Github allows for your picture to be a maximum of 2mb but we'll need our picture to be way lower than that so it doesn't compress it. Ive tried somewhere between 200-300kb and that has seemed to work for me.

<https://imagecompressor.11zon.com/en/compress-image/compress-image-to-300kb>

2nd) Next you'll want to upload this now compressed pfp as your github profile picture.

3rd) Once your profile picture has updated on your profile you'll want to download it. Simply right click your pfp on your profile and save the image.

4th) Now with the picture you just downloaded from github you can now encode a message into your picture. I don't know if other ways of hiding images works but I can say this type does.

<https://stylesuxx.github.io/steganography/> - for me I open the encoded image in a new tab since there was no save image as for me

5th) Now with your encoded image upload that as your github pfp. Do not zoom in or do anything to alter it just upload and save.

6th) Wait until your pfp updates it may take a few minutes. You can check by downloading it and then decoding the image on that same site. <https://stylesuxx.github.io/steganography/>

7th) The main reason this may not work is due to image size in terms data. The image should be very small somewhere between 200-300 kb should work
